**MODEL 2: THEORY QUESTION**

**KEYS**

1) What do you understand by Primary Key? Give a suitable example of Primary Key from a table containing some meaningful data. (OD 2010) 2

Ans. An attribute or set of attributes which are used to identify a tuple uniquely is known as Primary Key.

**Table: Item**

Ino	Item	Qty
I01	Pen	300
I02	Pencil	780
I04	CD	450
I09	Floppy	700

PRIMARY KEY

2) What is the importance of a primary key in a table? Explain with suitable example. (OD 2007)

Ans: **Primary Key:** A primary key is a set of one or more attributes that can uniquely identify tuples within the relations. A primary key comprises a single column or set of columns. No two distinct rows in a table can have the same value (or combination of values) in those columns. Depending on its designing, a table may have arbitrarily many candidate keys but at most one primary key. The primary key is non redundant. It does not have duplicate values in the same relation.

Eg: Consider a table consists the following attributes: AdmnNo, FirstName, LastName, SirName, M1, M2, M3, Total, Avg, FName

Here we can uniquely identify the rows in the relation with following key combinations:

- a) AdmnNo
- b) FirstName, LastName, SirName
- c) FirstName, LastName, FName, etc.

We can set any one of the above candidate keys as primary key, others are called as alternate keys.

3) Give a suitable example of a table with sample data and illustrate Primary and Candidate Keys in it. (2012 D)

Ans A table may have more than one such attribute/group of attribute that identifies a row/tuple uniquely, all such attribute(s) are known as Candidate Keys. Out of the Candidate keys, one is selected as Primary Key.

**Ex: Table: Stock**

Ino	Item	Qty
101	Pen	560
102	Pencil	780
104	CD	450
109	Floppy	700
105	Eraser	300
103	Duster	200

Here: Ino – Primary Key  
Ino, Item – Candidate Keys,

4) Give a suitable example of a table with sample data and illustrate Primary and Alternate Keys in it. (2012OD)

Ans A table may have more than one such attribute/group of attribute that identifies a row/tuple uniquely, all such attribute(s) are known as Candidate

Keys. Out of the Candidate keys, one is selected as Primary Key. while the rest are the Alternate Keys.

**Ex: Table: Stock**

Ino	Item	Qty
101	Pen	560
102	Pencil	780
104	CD	450
109	Floppy	700
105	Eraser	300
103	Duster	200

Here: Ino, Item – Candidate Keys,  
Ino – Primary Key  
Item – Alternate Key

Explain the concept of candidate key with the help of an appropriate example. (2013)(2010D)(D2009)2

5) What is the purpose of a key in a table? Give an example of a key in a table. (OD 2009)2

Ans) An attribute/group of attributes in a table that identifies each tuple uniquely is known as a Key.

OR

Any correct definition of Key / Primary Key / Candidate Key / Alternate Key

**Table:Item**

Ino	Item	Qty
I01	Pen	560
I02	Pencil	780
I04	CD	450
I09	Floppy	700
I05	Eraser	300
I03	Duster	200

Key

6) Differentiate between Candidate key and Primary key in context of RDBMS. (D2008)

Differentiate between Candidate Key and alternate Key in context of RDBMS. (OD 2008)

Differentiate between primary key and alternate key. (D2007)

What is an alternate key? (D2006)

What do you understand by the terms primary key and degree of a relation in relational data base? (D2005)

What do you understand by the candidate key and cardinality of a relation in relational data base? (OD 2005)

What is primary key in a table? (2003)

Ans) **Candidate Key:** All attribute combinations inside a relation that can serve primary key are Candidate Keys as they are candidates for the primary key position.

**Primary Key:** A primary key is a set of one or more attributes that can uniquely identify tuples within the relations.

**Alternate Key:** A candidate key that is not the primary key is called an Alternate Key.

(Where Candidate Key: All attribute combinations inside a relation that can serve primary key (uniquely identifies a row in a relation) are Candidate Keys as they are candidates for the primary key position.)

**Table: Stock**

Ino	Item	Qty
101	Pen	560
102	Pencil	780
104	CD	450
109	Floppy	700
105	Eraser	300
103	Duster	200

**Here:** Ino, Item – Candidate Keys,  
Ino – Primary Key  
Item – Alternate Key

**7) What is a relation? What is the difference between a tuple and an attribute? (1998)**

**Ans:** In relational data model, the data is organized into table (rows and columns). These tables are called relations. A row in a table represents a relationship among a set of values.

Rows of the relations are called as tuples and columns of the relations are called as attributes.

**8) What do you understand by Degree and Cardinality of a table? (MP109-10) (MP108-09)2**

**Ans) Degree:** Number of Columns in a table

**Cardinality:** Number of rows in a table

**Ex: TABLE : MEMBER**

MNO	MNAME
M101	Namish Gupta
M102	Sana Sheikh
M103	Lara James

**Here, Cardinality = 3, Degree = 2**

**What do you understand by the candidate key and cardinality of a relation in relational data base? (OD 2005)**

### OPERATIONS

**9. Explain the concept of Cartesian Product between tables, with the help of appropriate example. (2014)(2001)**

**Answer) Cartesian Product (binary operator):** It operates on two relations and is denoted by X.

**The Cartesian product of two relations yields a relation with all possible combinations of the tuples of the two relations operated upon.**

**All tuples of first relation are concatenated with all the tuples of second relation to form the tuples of the new relation.**

The Cartesian product of two relations A and B is written as AXB. The Cartesian product yields a new relation which has a degree (number of attributes) equal to the sum of the degrees of the two relations operated upon.

The number of tuples (cardinality) of the new relation is the product of the number of tuples of the two relations operated upon.

**Eg: There are two relations as follows:**

**Relation 1: Student**

StudentN umber	StudentName	Hosteler
1	Ravi	Y
2	Robert	N
3	Raheem	Y

**Relation 2: Instructor**

InstructorName	Subject
K.Suman	Computer Science
P.Pavan	Electronics

The Cartesian product of these two relations, Student X Instructor, will yield a relation that have a degree of 5(3+2:sum of degrees of Student and Instructor) and a cardinality 6 (3 X 2: Product of cardinalities of two relations).

**The resulting relation is as follows:**

Stude nt Numb er	Student Name	Ho ste ler	Instructor Name	Subject
1	Ravi	Y	K.Suman	Computer Science
1	Ravi	Y	P.Pavan	Electronics
2	Robert	N	K.Suman	Computer Science
2	Robert	N	P.Pavan	Electronics
3	Raheem	Y	K.Suman	Computer Science
3	Raheem	Y	P.Pavan	Electronics

**Resultant Relation = Relation1 X Relation2**

The resulting relation contains all possible combinations of tuples of the two relations.

**10) What do you understand by Union & Cartesian Product operations in relational algebra?(2011D)2**

**Ans) Union (binary operator):** It operates on two relations and is indicated by U.

For example, R= R1 U R2 represents union operation between two relations R1 and R2. The degree of R is equal to degree of R1. The cardinality of R is sum of cardinality of R1 and cardinality of R2.

Following have to be considered for the operation R1 U R2.

Degree of R1 = Degree of R2

jth attribute of R1 and jth attribute of R2

must have a common domain.

**Example :** **Relation R1**

Student_ID	Name
S120	Raju
S121	Nani

**Relation R2**

Student_Code	Student_Name
K550	Chinna
K551	Munna

**Resultant Relation : R = R1 U R2**

Student_ID	Name
S120	Raju
S121	Nani
K550	Chinna
K551	Munna

**11) What do you understand by Selection & Projection operations in relational algebra?**

(2011 OD)2

Ans Selection for selecting the rows of table  
Projection for selecting the columns of table

Ex: Table MEMBER

No	MNAME	STREAM
M001	JAYA	SCIENCE
M002	ADITYA	HUMANITIES
M003	HANSRAJ	SCIENCE
M004	SHIVAK	COMMERCE

TABLE : TABSEL

NO	MNAME	STREAM
M002	ADITYA	HUMANITIES

TABLE : TABPROJ

No	STREAM
M001	SCIENCE
M002	HUMANITIES
M003	SCIENCE
M004	COMMERCE

Here,

Table TABSEL is result of Selection operation

Table TABPROJ is result of projection operation

**DDL & DML**

**12) What are DDL and DML? (OD 2006)**

(Differentiate between data definition language and data manipulation language.(2002))

Ans: DDL means Data Definition Language. SQL DDL provides commands for defining relation schemas, deleting relations, creating indexes and modifying relation schemas. (Provides statements for the creation and deletion of tables and indexes.)

DML Means Data Manipulation Language. SQL DML provides statements to enter, update,delete data and perform complex queries on these tables.

(includes a query language to insert, delete and modify tuples in the database)

DML is used to put values and manipulate them in tables and other database objects and DDL is used to create tables and other database objects.

**12.STRUCTURED QUERY LANGUAGE**

(6 Marks)

**STUDENT MARKS TABLE**

In the following section many of the commands is explained through the example "Student marks table".

S.no	Attribute	Type
1	AdmnNo	Integer
2	SName	Character
3	Sub1	Real Number
4	Sub2	Real Number
5	Sub3	Real Number
6	Total	Real Number
7	Avg	Real Number
8	Divison	Character

**1. Create Table:**

CREATE TABLE <table-name> (<column name><data type>[(size)],<column name><data type>[(size)],...);

Example: To create a table consisting the Admnno, SName, Sub1, Sub2, Sub3, Total,Avg,Divison attributes.

CREATE TABLE Student (AdmnNo integer,SName char(20), Sub1 number(5,2), sub2 number(5,2), sub3 number(5,2), Total number(5,2),Avg number(5,2), Div Char(10));

**2.Constraints:**

- (i) **NOT NULL :** The attribute that contains this constraints should not be vacant.
- (ii) **Unique constraints:** This constraint ensures that no two rows have the same value in the specified column(s).
- (iii) **Primary key constraints:** This constraint declares a column as the primary key of the table.( Primary keys cannot allow NULL values)
- (iv) **Default constraints:** A default value can be specified for a column using DEFAULT clause. When a user does not enter a value for the column, automatically the defined default value is inserted in the field.
- (v) **Check constraints:** this constraint limits values that can be inserted into a column of a table.

Above table can be created using the constraints as follows:

CREATE TABLE Student (AdmnNo number(4) NOT NULL PRIMARY KEY, SName char(20), Sub1 number(5,2) CHECK(Sub1<=100.0), Sub2 number(5,2) CHECK(Sub2<=100.0), Sub3 number(5,2) CHECK (Sub3<=100.0), Total number(5,2),Avg number(5,2),Div char(10));

**3.INSERT Command:**

INSERT INTO <tablename>[<column list>] VALUES(<value>,<value>...);

Eg:

**i) To insert our desired attributes only:**

INSERT INTO Student (Admnno,SName,Sub1,Sub2,Sub3) Values (1000,'pradeep',75.5,90.5,57.0);

**ii) To insert all the attributes:**

INSERT INTO Student Values (1001, 'sudeep',77.50,95.0,68.50, 41.0,80.33,'First');  
(for inserting number of rows in a easy way...)  
INSERT INTO STUDENT(Admnno,SName,Sub1,Sub2, Sub3) VALUES (&Admnno, &SName, &Sub1, &Sub2, &Sub3);

Then it will ask first student data...Enter the data...then press / at command prompt. It will ask you next student data, etc.)

Sample Data Inserted

Adm n No	SNam e	Sub 1	Sub 2	Sub 3	Tot al	Avg	Di v
1000	Pradee p	75.5	95.0	57.0			
1001	Sudee p	77.5	95.0	68.5	241.0	80.33	Firs t
1002	Philip	32.5	60.0	59.5			
1003	Pradee p	45.5	65.5	70.0			
1004	Naidu	77.5	25.5	65.5			
1005	Sudee p	80.5	72.5	67.0			

**4.Select command:** Select command of SQL lets you make queries on the database. A query is a command that is given to produce certain specified information from the database table(s).

**Simple Form:**

SELECT <column name>[,<column name>...] FROM  
<table name>;

**Eg: Select AdmnNo, SName from Student.**

(Will display only AdmnNo and SName attributes of the table student.)

**Select \* from Student.**

(Will display all the attributes of the table Student.)

**5. DISTINCT Keyword:** This keyword eliminates duplicate rows from the results of a SELECT statement.

**Eg:** Select **DISTINCT** SName from Student

SName

Pradeep

Sudeep

Philip

Naidu

**6. ALL Keyword:** This keyword will not eliminate duplicate rows from the results of a SELECT statement.

**Eg:** Select **ALL** SName from student

SName

Pradeep

Sudeep

Philip

Pradeep

Naidu

Sudeep

**7. Selecting specific rows using WHERE clause with SELECT:**

**Syntax:** SELECT <column name>[<column name>,...] FROM <table name> WHERE <condition>;

**Eg:**

SELECT Admnno, SName FROM Student WHERE

Sub1 >= 40 AND Sub2 >= 40 AND Sub3 >= 40;

SELECT SName FROM Student WHERE

SName = 'Sudeep' OR SName = 'Philip';

SName

Sudeep

Sudeep

SELECT SName FROM Student WHERE SName NOT

IN('Sudeep', 'Pradeep');

SName

Philip

Naidu

SELECT SName FROM Student WHERE SName LIKE

'%ceep'

SName

Pradeep

Sudeep

Pradeep

**8. Condition based on a Range using BETWEEN:**

**Eg:** SELECT AdmnNo, SName FROM Student

WHERE AdmnNo BETWEEN 1003 AND 1005;

AdmnNo      SName

1003      Pradeep

1004      Naidu

1005      Sudeep

**9. ORDER BY:**

SELECT AdmnNo, SName from student ORDER BY  
SName ASC;

Admn No	SName
1004	Naidu
1002	Philip
1000	Pradeep
1003	Pradeep
1001	Sudeep
1005	Sudeep

SELECT AdmnNo, SName from student ORDER BY  
AdmnNo DESC;

Admn No	SName
1005	Sudeep
1004	Naidu
1003	Pradeep
1002	Philip
1001	Sudeep
1000	Pradeep

**10. UPDATE COMMAND:**

UPDATE Student SET Total= Sub1+Sub2+Sub3;

UPDATE Student SET Avg=Total/3;

UPDATE Student SET Div='First' WHERE (Avg >= 60.0);

UPDATE Student SET Div='Second' WHERE

(Avg >= 50.0 AND Avg < 60.0);

UPDATE Student SET Div='Third' WHERE (Avg >= 35.0

AND Avg < 50.0);

UPDATE Student SET Div='Fail' WHERE (Sub1 < 35.0

OR Sub2 < 35.0 OR Sub3 < 35.0);

**After the execution of the above commands, the sample data will be as follows:**

Admn No	SName	Sub1	Sub2	Sub3	Total	Avg	Div
1000	Pradeep	75.5	95.0	57.0	227.5	75.85	First

**5 In networking, what-is WAN? How is it different from LAN? (2011) 1**

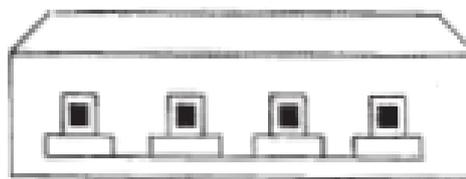

**Ans** A WAN (wide area network), is not restricted to a geographical location, although it might be confined within the bounds of a state or country. A WAN connects several LANs, and may be limited to an enterprise (a corporation or an organization) or accessible to the public. The technology is high speed and relatively expensive. The Internet is an example of a worldwide public WAN.

A LAN (local area network) is a group of computers and network devices connected together, usually within the same building or campus.

Interconnects a high number of access or node points or stations within a confined physical area. An example is the territory covered in a single office building that houses various departments/offices. All these areas are interconnected using a LAN.

**WAN (Wide Area Network)**

It is used to connect systems with no limitation of geographical area. It is used to serve many locations distributed over a large geographical area. A system of overnight teller machines used by a banking organisation covering the North of India is an example of a WAN. Internet is also an example of the same.

It then looks for a free link to another switching office and sends data to that office. This process continues until data is delivered to the destination computer	The source computer sends data (message) in a fixed size of <b>Packet</b> to the switching office, which stores data in <b>main memory</b> . It then looks for a free link to another switching office and sends data to that office. This process continues until data is delivered to the destination computer
Message Switching follows store and forward principle for complete message.	Packet Switching follows store and forward principle for fixed packets

**4) What is the purpose of using a MODEM? (2000)1**

**5) What is a Modem? (2002)1**

**6) What is a bridge? (1999)1**

**A)** A bridge is a device that lets you link two networks together. Bridges are smart enough to know which computers are on which side of the bridge, so they only allow those messages that need to get to the other side to cross the bridge. This improves performance on both sides of the bridge.

As a packet arrives at the bridge, the bridge examines the physical destination address of the packet. The bridge then decides whether or not to let the packet cross.

**OR**

A bridge is a network device that establishes an intelligent connection between two local networks with the same standard but with different types of cables.

**7) What are Routers? (2000)1**

A) A router is a network device that is used to separate different segments in a network to improve performance and reliability. A router works like a bridge but can handle different protocols.

Compared to hubs and switches, routers are smarter still. Routers use a more complete packet address to determine which router or workstation should receive each packet next. Based on a network road map called a routing table routers can help ensure that packets are travelling the most efficient paths to their destination. If a link between routers fails, the sending router can determine an alternate route to keep traffic moving.

**DATA TRANSFER UNITS**

**1) Define the term Bandwidth. Give any one unit of Bandwidth. (MP208-10)(MP209-10)1**

**Ans** The amount of data that can be transmitted in a fixed amount of time is known as bandwidth.

For digital devices, the bandwidth is usually expressed in bits per second (bps) or bytes per second. For analog devices, the bandwidth is expressed in cycles per second, or Hertz (Hz)

**11) What is the difference between Virus and Worms in the computers? (OD2010)1**

**Ans.Virus:** Virus is a malicious program that damages data and files and causes harm to computer system.

**Worms:** Worms disrupt services and create system management problems. In some cases worms can install viruses that cause damage to system.

**12) How Trojan Horses are different from Worms? Mention any one difference. (MP209-10)1**

**Ans)**A Trojan horse is a term used to describe malware that appears, to the user, to perform a desirable function but, in fact, facilitates unauthorized access to the user's computer system.

A computer worm is a self-replicating computer program. It uses a network to send copies of itself to other nodes (computers on the network) and it may do so without any user intervention.

**13) What term we use for a software/hardware device, which is used to block, unauthorized access while permitting authorized communications. This term is also used for a device or set of devices configured to permit, deny, encrypt, decrypt, or proxy all (in and out) computer traffic between different security domains based upon a set of rules and other criteria. (D2010)1**

**Ans.** Firewall

**Firewall:** Any of a number of security schemes (hardware/software) that prevent unauthorized users from gaining access to a computer network or that monitor transfers of information to and from the network.

**14)Define the term firewall. (MP208-10)1**

**Ans) Firewall** is a feature used for Network Security. In a Network there is always danger of information leaking out or leaking in. Firewall is a feature which forces all information entering or leaving the network to pass through a check to make sure that there is no unauthorized usage of the network.

**15) How firewall protect our Network? (MP209-10)1**

**Ans)**A **firewall** is a part of a computer system or network that is designed to block unauthorized access while permitting authorized communications. It is a device or set of devices configured to permit, deny, encrypt, decrypt, or proxy all (in and out) computer traffic between different security domains based upon a set of rules and other criteria.

**16) What do you mean by IP Address? How is it useful in Computer Security? 1**

**Ans)** An Internet Protocol (IP) address is a numerical identification and logical address that is assigned to devices connected in a computer network. An IP

Address is used to uniquely identify devices on the Internet and so one can quickly know the location of the system in the network.

**17) What do you mean by Spam Mails? How can you protect your mailbox from Spams? (2000)**

**5) What is the importance of URL in networking?**

**(MP208-10) (MP209-10)1**

**Ans)** **URL** stands for Uniform Resource Locator. Each page that is created for Web browsing is assigned a URL that effectively serves as the page's worldwide name or address. . A URL is also referred to as a Web address.

URL's have three parts: the protocol , the DNS name of the machine on which the page is located and a local name uniquely indicating the specific page (generally the filename).

**Theory Question : XML & HTML**

**1. Differentiate between XML and HTML. (2011) (OD2005) 1**

HTML	XML
Full form is Hyper Text Mark Up Language	Full form of XML is extensible mark up language
It contains predefined tags	It contains user defined tags
predominant markup language for the creation of web pages.	Initially visualized as a language for defining new document formats for the World Wide Web
It provides a means to describe the structure of text-based information in a document by denoting certain text as headings, paragraphs, lists, and to supplement that text with interactive forms, embedded images, and other objects using predefined Tags.	XML is textbased formats that provide mechanisms for describing document structures with the help of user defined Tags.

**2) When do you prefer XML over HTML and why? (MP209-10)1**

**Ans** The first benefit of XML is that because you are writing your own markup language, you are not

restricted to a limited set of tags defined by proprietary vendors.

Rather than waiting for standards bodies to adopt tag set enhancements (a process which can take quite some time), or for browser companies to adopt each other's standards (yeah right!), **with XML, you can create your own set of tags at your own pace.**

**Theory Question : Scripts & Cookies**

**1) Classify each of the following Web Scripting as Client Side Scripting and Server Side Scripting: (2018)**

(iii) Client Side Scripting

(iv) Server Side Scripting

**2) Categories the following under Client side and Server Side script category? (2016)(2011)**

(i) Java Script (ii) ASP

(iii) VB Sript (iv) JSP

Client Side Scripts	Server Side Scripts

**3) Name one server side scripting language and one client side scripting language. (2012)1**

**Ans**

Ex. Of Client Side Scripts	Ex. Of Server side Scripts
VB Script	ASP
Java Script	JSP
Peril Tcl	PHP
TK	CGI
REXX	Perl

**4) Which of the following is not a Client Side script: (MP109-10)1**

(i) VB Script (ii) Java Script

(iii) ASP (iv) PHP

**Ans**(iii)ASP and (iv) PHP are not client side scripts

**5. What are cookies? (2011)**

**Ans** A small piece of information that a server sends to a client. When a person visits a Web site with cookie capabilities, its server sends certain information about him/her to the browser, which is stored on his/her hard drive as a text file. At some later time (such as returning to the site the next day), the server retrieves the cookie.

**6) What kind of data gets stored in cookies and how is it useful? (2015)1**

**Ans** When a Website with cookie capabilities is visited , its server sends certain information about the browser, which is stored in the hard drive as a text file. It's a way for the server to remember things about the visited sites.

**7) What do you understand by the terms Cookies and Firewall? (OD2005)1**

**Ans)Cookies:** A small piece of information that a server sends to a client. When you visit a Web site with cookie capabilities, its server sends certain information about you to your browser, which is stored on your hard drive as a text file. At some later time (such as returning to the site the next day), the server retrieves the cookie. It's a way for the server to remember things about you.

### Theory Question : Open Source Softwares

**1. Write the name of any two popular Open Source Software which are used as operating systems. 2014**

**Ans:** Linux and Unix are two open source operating systems.

**(2) Write two advantages of using open source software over proprietary software. 2013**

**A) Two advantages of using open source software over proprietary software are:**

Open Source Software is software whose source code is available to customer and it can be modified and redistributed without any limitations whereas source code of proprietary software is not available.

Open Source software may come free of cost or with payment of normal charges whereas proprietary software is neither open nor freely available.

**(3) Name two Proprietary softwares along with their application. (2012)1**

**Ans** Microsoft Office - For office applications

Adobe Photoshop - For design related works

Autocad - For professional Design

MAYA - For professional animations & Movie making

3D Studio - For 3 dimensional objects

Tally - For accounting

Oracle Database - For database management

**(4) Compare Open Source Software and Proprietary Software. (2011)1**

**Ans** Open source software refers to a program or software in which the source code (the form of the program when a programmer writes a program in a particular programming language) is available to the general public for use and/or modification from its original design free of charge.

Proprietary software is software that is owned by an individual or a company (usually the one that developed it). There are almost always major restrictions on its use, and its source code is almost always kept secret.

**6) Write one advantage of each for Open Source Software and Proprietary Software. 1**

**Ans.** An Open Source Software is freely and liberally licensed because of which users have right to study, change, and improve its design and source code. A Proprietary Software has a copyright owner, who can restrict the user's control over the software, its modification, or restrictions in publishing of modified or unmodified versions.

**7) Mention any two advantages of Open Source Software over Proprietary Software. (2000)**

**Ans)**Open Source's proponents often claim that it offers significant benefits when compared to typical Proprietary Software. Proprietary Software typically favour visible features (giving marketing advantage) over harder-to-measure qualities such as stability, security and similar less glamorous attributes.

Open Source Software developers are evidently motivated by many factors but favouring features over quality is not noticeable amongst them. For many developers, peer review and acclaim is important, so it's likely that they will prefer to build software that is admired by their peers. Highly prized factors are clean design, reliability and maintainability, with adherence to standards and shared community values preeminent.

**8) Compare freeware and Shareware. (MP209-10)1**

**Ans)Freeware,** the name derived from words "free" and "software". It is a computer software that is available for use at no cost or for an optional fee. Freeware is generally proprietary software available at zero price, and is not free software. The author usually

restricts one or more rights to copy, distribute, and make derivative works of the software.

**Shareware** is usually offered as a trial version with certain features only available after the license is purchased, or as a full version, but for a trial period. Once the trial period has passed the program may stop running until a license is purchased. Shareware is often offered without support, updates, or help menus, which only become available with the purchase of a license. The words "free trial" or "trial version" are indicative of shareware.
